A. General Specification

Physical specification

Parameter	Value	
LCD		
Graphic format	2160 x2(RG/BR/GB)x3840 pixels (UHD)	
Technology	LTPS TFT	
Display thickness	1.276mm	
Active area	68.04 mm x 120.96 mm	
Viewing area	68.50 mm x 121.42 mm	
Diagonal size LCD	5.46 inch	
Pixel pitch	31.5 μm	
Illumination mode	Transmissive, Normally black	
Illumination type	RG phosphor LED Backlight	
Color depth	24bit (16M colors)	
Display Driver	Novatek, NT35950	

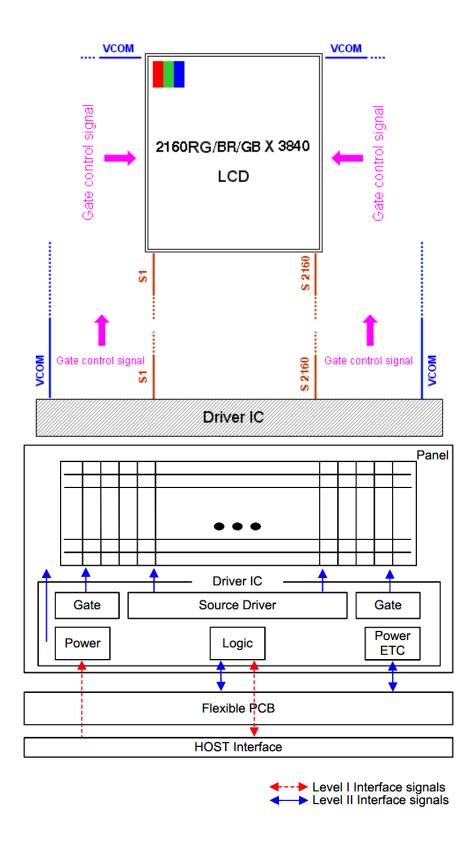

Abbreviations

Abbreviation	Explanation
TFT	Thin Film Transistor
LCM	Liquid Crystal Module
LCD	Liquid Crystal Display
ESD	Electrostatic Discharge
GND	Ground
RGB	Red Green Blue
CPU	Central Processor Unit
CR	Contrast Ratio
COF	Chip On Foil
COG	Chip On Glass
FPC	Flexible Printed Circuit, also known as flex
I/F	Interface
IC	Integrated Circuit
ITO	Indium-Tin-Oxide
LED	Light Emitting Diode
ZIF	Zero Insert Force
BtB	Board to Board

Pin assignment

The interface of the LCD assembly consists of 60 interconnections. 46 connections are used for the LCD. 10 connections are used for touch panel, 4 connections are used for the LEDs.

- 3 Input power (BTM="0") with external DVDD (EXT_DVDD_EN="1"): VDDI=1.65~1.95V, DVDD=1.1~1.3V, AVDD=4.5~6.3V, AVEE=-4.5~-6.3V

- Note 1: Unless otherwise specified, timings herein show cross point at 50% of signal/power level.
- Note 2: This power-on sequence is based on adding schottky diode on VGLX pin to AVEE pin.
- Note 3: Reset signal H to L to H (#1) is better than only L to H (#2).

Display Driver Chip

The display driver chip is a Novatek, N35950 mounted directly onto the glass substrate by COG. And for detailed information please refer to [Ref 1].

The FPC is heat sealed to the TFT. The backlight flex is ZIF type connecting with Main FPC. The Main FPC carries external components such as resistors and capacitors.

Dendrite Growth (metallic growth between pads in the presence of moisture and an electrical bias) is not allowed.

Backlight

The backlight consists of 18 white LEDs coupled into a light guide. The even illuminated area covers at least the LCD active area.

a. White LEDs

6 LEDs in series for a group, and 3 groups do the parallel. The LEDs are bonded to the backlight flex.

Definitions of Optical Parameters

a. Luminance

The luminance is measured at center point of the display with a white picture. The unit is cd/m2.

b. Contrast

Contrast is measured by taking the ratio of the luminance of White and the luminance of Black. The contrast is measured over an area and not on single pixels.

 $CR = \frac{L_{WHITE}}{L_{BLACK}}$

Version: 1.3

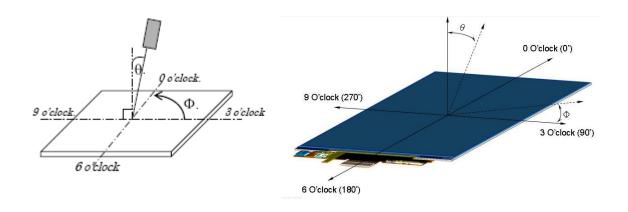

Page: 24/28

Transmissive measuring conditions: perpendicular to the glass, normal mode, illuminated with backlight system.

Page: 25/28

c. Viewing angle and viewing direction.

Definition of viewing angle and viewing direction

Optimal viewing direction is the viewing direction for which the display optical characteristics are optimized.

d. NTSC ratio

$$NTSC = \frac{\left\| R\vec{G}_{LCD} \times R\vec{B}_{LCD} \right\|}{\left\| R\vec{G}_{NTSC} \times R\vec{B}_{NTSC} \right\|}$$

 $R\vec{G}$ is the vector from Red u,v to Green u,v and $R\vec{B}$ is the vector from Red u,v to Blue u,v. u and v are coordinates in the CIE1976 color system.

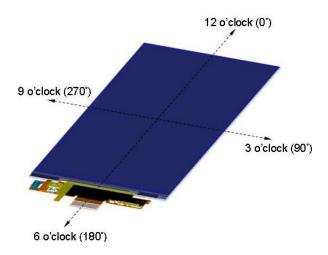

The NTSC-coordinates are set by:

Color	NTSC u'	NTSC v'
Red	0.499	0.522
Green	0.102	0.574
Blue	0.175	0.128

Page: 26/28

e. Polarization Transmission angle

Polarization transmission angle

Polarization transmission angle is the transmission axis of the polarizer. Light coming from the display shall have a polarization direction that enables user to read the display with standard polarized sunglasses. The polarization orientation shall not be vertical & horizontal, the angle between polarizer & Vertical (or Horizental) axis should equal or lager than 15°. Circular polarizer is preferred.
